## Imaging Guided Interventions: Focus on Architectural Distortion

Lilian Wang, MD  
Assistant Professor of Radiology  
Northwestern Medicine

### Overview

- Definition
- Etiologies
- Diagnostic evaluation
- Methods for tissue sampling
- Radiology pathology concordance

### BI-RADS Definition: Mammography

- Thin straight lines or spiculation radiating from a point

### BI-RADS Definition: Mammography

- Focal retraction, distortion, or straightening at the anterior or posterior edge of the parenchyma

### BI-RADS Definition: Mammography

- May be associated with asymmetry or calcifications
- Can also be an associated feature of a mass

### AD = "Black star"

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## BI-RADS Definition: Ultrasound

- Listed as associated feature
- Compression of the tissue around the mass
- Obliteration of the tissue planes by an infiltrating lesion
- Straightening or thickening of Cooper's ligaments
- Aberrations of ductal pattern

## BI-RADS Definition: MRI

- Associated feature
- Used in conjunction with another finding to indicate that the parenchyma is distorted or retracted adjacent to the finding

## Architectural Distortion

- Third most common imaging appearance of breast cancer.
- 12-45% of missed breast cancers on 2D screening mammography

## Detection of AD

- Increased with DBT
  - Better visualized due to reduced superimposition
  - May reveal underlying mass with distortion

Study	Recall rate (% exams)		PPV3	
	DM	DBT	DM	DBT
Lourenco Radiology, 2015	0.6%	5.3%	100%	50%
Vijapura AJR, 2018	0.3%	0.6%	88%	68%
McDonald Radiology, 2017	6.1%	9.9%	-	-
Bahl* AJR, 2017	0.07%	0.14%	73.6%	7%
Partyka AJR, 2014	-	0.5%	-	44%

\*mammogram exams (diagnostic and screening)

## Is there really AD?

- Overall lowest levels of interobserver agreement
- Agreement in mammographic interpretation was 43% for AD vs 100% for masses<sup>1</sup>
- Agreement among 10 experienced academic breast radiologists for AD fair ( $k=0.67$ )<sup>2</sup>
- Significantly lower sensitivity for AD vs. non-AD<sup>3</sup>

<sup>1</sup>Onega T, Smith M, Miglioretti DL, et al. J Am Coll Radiol 2012; 9:788-794.  
<sup>2</sup>Lee AY, Wisner DJ, Aminolomana-Shakeri S, et al. Acad Radiol. 2017 Jan;24(1):60-66.  
<sup>3</sup>Soleman WJ, McEneaney WF, Lewis SJ. Clin Radiol. 2016 Jun;71(11):1035-40.

### Interobserver Variability

- 3 readers agreed on presence of AD in only 26 of 51 recalls for AD.<sup>1</sup>
- 181 AD (122 2D, 59 DBT), 3 readers:<sup>2</sup>
  - Fair agreement,  $\kappa = 0.29-0.37$
  - Moderate to substantial agreement for level of suspicion
    - $\kappa = 0.51-0.64$ , 79.3-84.4% agreement
    - $\kappa = 0.32-0.36$  for 2D-detected lesions
    - $\kappa = 0.14-0.36$  for DBT-detected lesions

<sup>1</sup>Partiyya et al., Detection of mammographically occult architectural distortion on digital breast tomosynthesis screening: initial clinical experience. AJR 2014.  
<sup>2</sup>Apantaku et al., Outcome of architectural distortion detected only at breast tomosynthesis versus 2D mammography. Radiology 2018.

### Increased Agreement with DBT

- 59 AD patients and 59 controls, 4 readers
- DBT vs 2D:
  - decreased interobserver variability
  - increased reader confidence
  - improved sensitivity

Dibble et al., Comparison of digital mammography and digital breast tomosynthesis for detection of architectural distortion. Eur Radiol 2018.

### Etiologies

- Malignancy
- Radial scars and complex sclerosing lesions
- Post-procedural scars from surgery, biopsy, reduction mammoplasty
- Fibrosis
- Fat necrosis
- Sclerosing adenosis
- Fibromatosis with fibroblastic and myofibroblastic proliferation

### Correlate with Clinical History

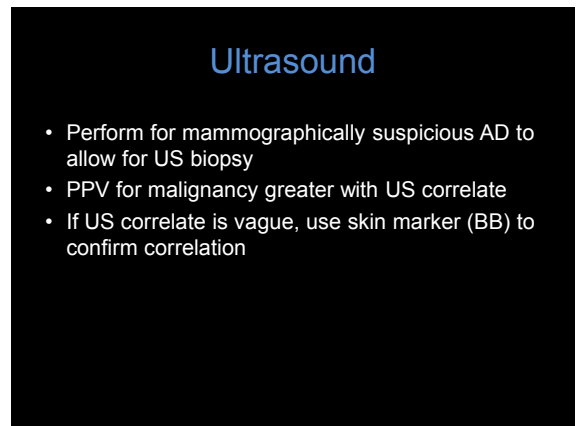

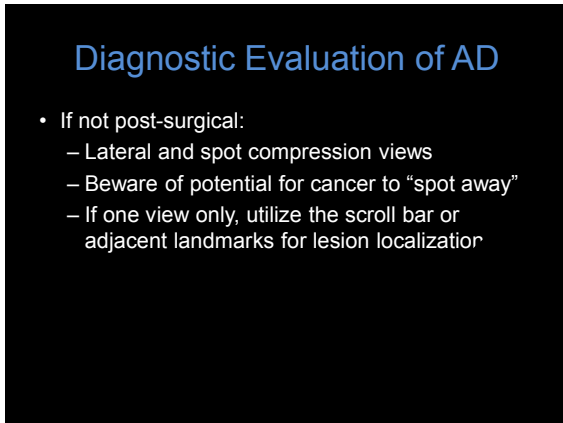

- In absence of history of trauma or surgery, AD is considered suspicious → tissue diagnosis

### Post-surgical AD

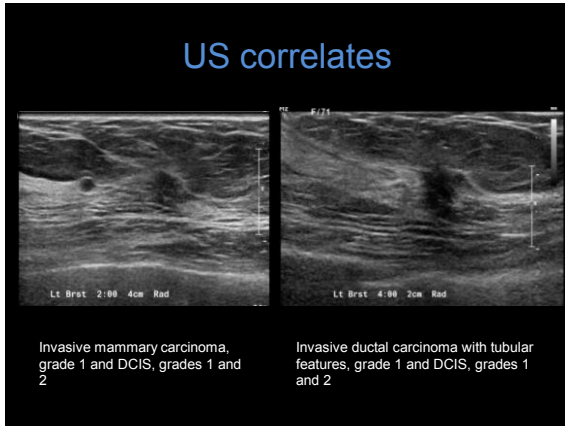

### Diagnostic Evaluation of AD

- If presumed post-surgical, confirm with scar marker

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## 62-year-old woman annual mammography

## Post-biopsy clip correlation

## 47-year-old recalled from screening mammography

## US biopsy clip does not correlate

## Stereotactic biopsy was performed

## Tissue Sampling

- If US correlate, US biopsy can be performed with confirmation of clip on post-biopsy MG
- AD without US correlate has PPV >2% → therefore tissue sampling warranted

Study	% cancer DBT-only AD
Partyka AJR, 2014	21% (4/19)
Freer Radiology, 2015	47% (17/36)
Ray Breast J, 2015	36% (5/14)
Patel AJR, 2018	26% (9/34)
Alshafeiy Radiology, 2018	10% (6/59)
Pujara Clin Imaging, 2019	9% (1/11)

## Tissue Sampling

- If no US correlate:
  - DBT-guided biopsy
  - Stereotactic biopsy utilizing landmarks
  - Excisional biopsy after DBT needle localization
  - MRI for problem solving
  - CESM for problem solving

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## Post-biopsy clip confirmation

## Bilateral radial scars

## Radial scar

- Benign lesion characterized by a central fibroelastic core surrounded by radiating ducts and lobules
- Referred to as complex sclerosing lesions if >1 cm in size
- 14-26% of patients at autopsy<sup>1</sup>
- 0.9 per 1000 prevalence screening exams<sup>2</sup>
- 0.8-1.8% of image-guided biopsies<sup>3,4</sup>

<sup>1</sup>Wellings et al. Subgross pathologic features and incidence of radial scars in the breast. Human Pathol. 1976;7:165-177.  
<sup>2</sup>Faber and Dean. Teaching atlas of mammography. 3rd ed. 2001.  
<sup>3</sup>Werner et al. Radial scar diagnosis by core needle biopsy: is surgical excision necessary? Springerplus. 2015;4:1111.  
<sup>4</sup>Linda et al. Radial scars without atypia diagnosed at imaging-guided needle biopsy: how often is associated? mammography and sonography predict which lesions are malignant? AJR. 2010;184:1111-1117.

## Radial scars and breast cancer

- Not more malignant lesions
- Proliferative lesions that often coexist with other proliferative lesions, including atypia, that may contribute to upgrade
- Coexist with cancers at a higher frequency than chance alone
- Likely does not impart increased risk of future breast cancer,<sup>1,2</sup> although literature mixed<sup>3</sup>

<sup>1</sup>Sanders et al. Interdependence of radial scar and proliferative disease with respect to invasive breast carcinoma risk in patients with benign breast biopsies. Cancer. 2006.  
<sup>2</sup>Berg et al. Breast cancer risk in women with radial scars in benign biopsies. Breast Cancer Res Treat. 2008.  
<sup>3</sup>Jacobson et al. Radial scars in benign breast-biopsy specimens and the risk of breast cancer. New Engl J Med. 1999.

## Upgrade of Radial Scars

- Upgrade rate 0-7% (usually to DCIS):
  - sampling method
  - biopsy device and gauge
  - number of samples
  - targeted abnormality
  - associated atypia
  - criteria for excision (selection bias)
  - imaging-pathology concordance/discordance

Cohen and Newell. Radial scars of the breast encountered at core biopsy: Review of Histologic, Imaging, and Management Considerations. AJR. 2017;206:1168-1177.

## Upgrade of Radial Scars

- Larger-gauge vacuum-assisted devices and more cores → significantly lower upgrade rates<sup>1</sup>
  - For RS without atypia:
    - 5% 14G CNB
    - 2% 8-16G CNB
    - 1% VAB
- Cancers often identified in a peripheral location within radial scars → potential undersampling at CNB site<sup>2</sup>

<sup>1</sup>Farshid and Buckley. Meta-analysis of upgrade rates in 3163 radial scars excised after needle core biopsy diagnosis. Breast Cancer Res Treat. 2019; 174(1):165-177.  
<sup>2</sup>Chopra-Jones et al. Radial scar lesions of the breast diagnosed by needle core biopsy: analysis of cases containing occult malignancy. J Clin Pathol. 2007;60:295-298.

## Management of Radial Scars

- Traditionally surgical excision due to risk of associated malignancy based on film-screen, FFDM and/or US findings
- Review: upgrade rate pure RS – 3.4% (0-16%)<sup>1</sup>

1. Chou et al. Radial scar on image-guided breast biopsy: is surgical excision necessary? Breast Cancer Research and Treatment 2018.

## DBT and Radial Scars

- DBT → increased AD → increased RS
  - 15.3% of HRL in DBT group vs. 9.7% in DM group<sup>1</sup>
  - 33.2% of AD in DBT group vs. 11.6% in DM group<sup>2</sup>
  - 0.13% of exams in DBT group vs 0.04% in DM group<sup>3</sup>
  - Associated malignancy rate 2-29%<sup>1, 4-5</sup>

5. Freer et al. Preoperative tomosynthesis-guided needle localization of mammographically and sonographically occult breast lesions. Radiology 2015.

## Radial scars without atypia

- Low upgrade rates reported:
  - 0% (0/100)<sup>1</sup>
  - 0% (0/39, 0/13, 0/15)<sup>2-4\*</sup>
  - 2% (2/91)<sup>5</sup>
  - 4% (5/128 – AD 3/5 cases)<sup>6</sup>

4. Ashrafy et al. Outcome of Architectural Distortion Detected Only at Breast Tomosynthesis. Breast Cancer Res Treat 2019.  
5. Chou et al. Radial scar on image-guided breast biopsy: is surgical excision necessary? Breast Cancer Res Treat 2018.  
6. Benmer et al. Percutaneous Core Needle Biopsy of Radial Scars of the Breast: When Is Excision Necessary? AJR 2009.

## MR for Radial Scars

- High-risk lesions, including 54 radial scars
  - NPV for radial scar = 97.6%
  - 1 FN: low-grade DCIS
  - Clinical and imaging follow-up with normal MR findings?

Linda et al. Nonsurgical management of high-risk lesions diagnosed at core needle biopsy: can malignancy be ruled out safely with breast MR? AJR 2012.

## Radial Scar Management: Controversial

- Excise all?
- Case by case analysis?
- Imaging and clinical follow-up?

## Management Considerations

- Has target been sufficiently sampled?
  - Consider # cores and gauge, lesion size
  - Is clip in appropriate position?
- Is pathology concordant with imaging findings?
- Is radial scar incidental?
- Patient factors: current cancer or personal history of breast cancer, high risk factors

# CIBC 2019

## Potential Management Algorithm: Radial Scars

- <1 cm, concordant → imaging follow-up
- >1cm, concordant → consider excision or repeat sampling with large gauge vacuum-assisted device
- Incidental, concordant → imaging follow-up

Newell et al. Radial Scars of the Breast Encountered at Core Biopsy: Review of Histologic, Imaging, and Management Considerations. AJR 2017.

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

57-year-old woman recalled from screening mammography.

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

On follow-up MG, persistent AD. Stereotactic biopsy recommended.

Pathology: Breast tissue with intraductal papilloma (0.2 cm), sclerosing adenosis, usual ductal hyperplasia, apocrine metaplasia, columnar cell change, columnar cell hyperplasia, microcysts and microcalcifications.

After review of pathology and imaging at Radiology Pathology concordance conference, pathology was considered benign and concordant.  
Six month mammographic follow-up was recommended.

Due to concern for developing mass/asymmetry associated with AD, surgical excision was recommended.

Surgical pathology: ID papillomas, sclerosing adenosis, UDH, PASH.  
Re-review of pathology: significant fibrosis felt to account for the AD.

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

56-year-old recalled from screening mammography.

## Diagnostic Mammogram

Attempted stereotactic biopsy unsuccessful.  
Breast MRI recommended for further evaluation.

## Post-biopsy Mammogram

# CIBC 2019

72-year-old referred from OSH for MRI evaluation of AD L UOQ, no US correlate.

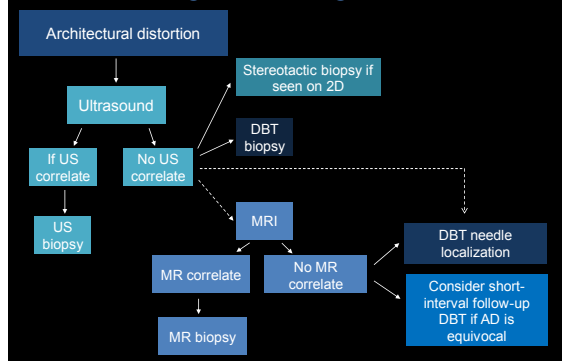

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## MRI for Problem Solving

- Can be useful for equivocal mammographic lesions
- Negative or equivocal MR: ambiguous finding likely not clinically significant → can do f/u
- Positive MR finding: increases clinical suspicion and can guide tissue diagnosis
- Not appropriate for suspicious, two-view mammographic findings for which biopsy is recommended
  - NPV of MR not considered high enough to obviate tissue diagnosis

## Diagnostic Algorithm

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## CESM for AD

- 49 AD with CESM prior to biopsy
  - 29 invasive cancers, 1 DCIS, 9 radial scars, 10 benign
  - 76% (37/49) AD showed enhancement
  - Sensitivity 97%, NPV 92%
  - 1 FN: 4 mm lesion within substantial BPE

Patel et al. Clinical utility of contrast-enhanced spectral mammography as an adjunct for tomosynthesis-detected architectural distortion. Clin Imaging 2017;46:44-52.

62-year-old recalled from screening mammography for AD in the R UIQ. History of 2 benign R MR biopsies for NME.

# CIBC 2019

Chicago International Breast Course  
 The Westin Chicago River North  
 November 1-3, 2019

## AD and Cancer Types

- More common in Luminal A and B tumors<sup>1</sup>
- Lower grade tumors<sup>2,3</sup>
  - 96% malignancies low or intermediate grade<sup>2</sup>
- Lobular histology<sup>2,4-7</sup>
- Most are invasive (>80%) vs DCIS
  - DCIS more common for DBT-only AD<sup>8</sup>

<sup>7</sup>Wahlqvist et al., Outcome of Architectural Distortion Detected Only at Breast Tomosynthesis versus 2D Mammography. Radiology. 2018.

## Can imaging features help predict malignancy?

- Greater likelihood of malignancy with 2D vs DBT
  - 43.5% vs 10.2%<sup>1</sup>
  - 88% vs 68%<sup>2</sup>
  - 73.6% vs 50.7%<sup>3</sup>

<sup>1</sup>Alshafiq et al., Radiology. 2018.  
<sup>2</sup>Vijapur et al., AJR. 2018.  
<sup>3</sup>Bali et al., AJR. 2017.

## Can imaging features help predict malignancy?

- Greater likelihood of malignancy with US correlate
  - 39.7% vs 11.1%<sup>1</sup>
  - 46% vs 15%<sup>2</sup>
  - 82.9% vs 27.9%<sup>3</sup>
  - 97% vs 83%<sup>4</sup>
  - 66.5% vs 29.2%<sup>5</sup>

<sup>1</sup>Alshafiq et al., Radiology. 2018.  
<sup>2</sup>Puata et al., Clin Imaging. 2019.  
<sup>3</sup>Bali et al., AJR. 2015.  
<sup>4</sup>Vijapur et al., AJR. 2018.  
<sup>5</sup>Bali et al., AJR. 2017.

## Can imaging features help predict malignancy?

- Trend toward increased malignancy rate for AD with Ca++ or asymmetries vs pure AD on DM<sup>1,2</sup>
- One-view only distortion can be malignant<sup>3</sup>
  - 23% (3/13) one-view AD malignant
  - 2 of 3: ILC
  - All seen on CC view only

<sup>1</sup>Bali et al., AJR. 2015.  
<sup>2</sup>Bali et al., AJR. 2017.  
<sup>3</sup>Puata et al., Clin Imaging. 2019.

# CIBC 2019

## Can imaging features help predict malignancy?

- Nonmalignant AD:
  - symmetric or spoke-wheel spiculation with central lucency
- Malignant AD:
  - asymmetric spiculation and central mass
- Nonmalignant AD either better detected or detected only on DBT.

Vijapura et al. Imaging Features of Nonmalignant and Malignant Architectural Distortion Detected by Tomosynthesis. AJR 2018; Dec:211(6):1397-1404.

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## Challenge Cases: Multiple AD

48-year-old recalled from screening mammography.

No definite sonographic abnormality identified to correspond to the numerous areas of architectural distortion seen on mammography.

Management?

### Problem-Solving MRI

MR biopsy = Radial scar

MR biopsy = Nodular sclerosing adenosis

### Radial Scar Appearance on MRI

- 29 radial sclerosing lesions<sup>1</sup>
  - 9 occult on MRI
  - 20 MRI: 1 focus, 10 masses, 4 NME, 5 “AD”
  - 7/9 RSL presenting as AD were visible on MR
- 18/30 AD were radial scars<sup>2</sup>
  - None showed enhancement on MRI

<sup>1</sup>Linda et al. Magnetic resonance imaging of radial sclerosing lesions (radial scars) of the breast. Eur J Radiol. 2012; Nov;81(11):2328-33. <sup>2</sup>Phillonis et al. Radial Scars of the Breast: Contrast-enhanced Magnetic Resonance Mammography. Am J Roentgenol. 2009; 193(1):111-117.

Surgical excision was not performed.

No interval mammographic change over 3 years.

55-year-old with history of excision of R radial scar/FEA, recent L stereotactic biopsy of ... at ... revealing radial scar.

Management?

- ### Surgical Pathology
- Left medial: multiple radial scars, multiple intraductal papillomas, sclerosing adenosis
  - Left lateral: multiple radial scars, multiple intraductal papillomas with associated UDH
  - Right breast lateral: multiple radial scars, multiple intraductal papillomas, sclerosing adenosis, PASH
  - Right inferior: multiple radial scars, ALH, FEA, multiple papillomas, PASH

# CIBC 2019

Chicago International Breast Course  
The Westin Chicago River North  
November 1-3, 2019

## Multiple Radial Scars

- Nurses' Health Study: 460 cases and 1792 controls with BBD
- Among women with RS
  - One RS 67.3%
  - Two RS 16.7%
  - $\geq 3$  RS 16.0%
- Women with multiple RS at higher risk of breast cancer than women with single RS (RR 2.7 vs 1.5,  $p = 0.12$ )

Avner et al. Radial scars and subsequent breast cancer risk: results from the Nurses' Health Studies. Breast Cancer Res Treat. 2013, Volume 139, Issue 1, pp 277-285.

## Bilateral Symmetric AD

62-year-old presents for annual mammography.  
History of breast reduction 2004.

**Management of Biopsy Results for AD**

- Malignant → excise
- High risk lesions
  - ADH → excise
  - Pleomorphic LCIS → excise
  - Radial scar → controversial
- Benign → nothing additional if adequate sampling and rad-path concordance

Summary

- AD is the most commonly missed manifestation of cancer with high interobserver variability
- Increased detection of AD with DBT
- Higher rate of malignancy with US correlate
- DBT-only AD warrants biopsy
- Careful post-biopsy evaluation paramount:
  - Radiology-pathology concordance
  - Post-biopsy clip correlation
